

## Digital Economy Committee Chair - Agenda Proposal

***Name of the Candidate: Jelena Milošević***

***Company of the Candidate: IBM***

Digital economy, touches all aspects of life. It creates an ecosystem where consumers and businesses operate with flexibility and speed, while governments serve both with agility and at optimal cost. It enables global access to markets and resources, democratizes access to information and holds great potential for local economic growth.

Yet, development of AI has raised concerns on cybersecurity, privacy, and welfare of labor force, which put challenge on governments to regulate but not inhibit innovation, competitiveness and technological advancement.

My proposal for the agenda 2025-2027 for Digital Economy Committee will explore challenges and provide recommendations in the 4 key pillars:

- Strategy and policy framework – Aiming for sustainable national digital economy, developed e-government services smart cities, removing restrictions to cloud services, innovation, AI by fine tuning legal framework that renders a predictable business and investment environment that fosters growth.
- Energy – Addressing how will digital economy and energy strategy intertwine to facilitate for the increasing energy demand by massive data centers that store and process vast amounts of data and by AI.
- Human capital – Supporting transformation of educational system to be responsive with curricula for profiles emerging in digital economy, for new skills needed on labor market, for reskilling people due to automation of tasks will be addressed.
- Digital Infrastructure – Securing it, attracting investments and become the leader in datacenters and data factories in the region.
